Candidate: Piciu Dragos-Cristian

Web application test plan and automation

Introduction

1. Create a document containing a simple test plan for https://automationexercise.com/ that describes what testing scenarios you consider are worth testing and why. Also describe how you can improve the application.

Note: The Test cases section already includes 26 test case scenarios. Add additional ones that you consider that add a plus value for the testing.

Additional Testing Scenarios

These scenarios are designed to cover areas not included in the existing 26 test cases.

Test Scenario	Execution Steps	Expected Result	Value Added
Add to Cart Rapidly Clicks T1	1.Navigate to a product page 2.Rapidly click "Add to Cart" 5 times. 3.Navigate to the Cart Page 4.Check if only one product has been added	The system should process only one request or disable the button after the first click.	Detects the pontential for duplicate orders and unnecessary repeated calls to the add to cart function.
Cart Persistence after Browser Restart T2	1.Add a product to the cart. 2.Close the browser competly. 3.Reopen the browser and navigate back to the site. 4.Check Cart Page.	The cart should still contain the added product.	Detects if the application correctly manage user sessions.

Payment Field Input Validation T3	1.Add products to cart & click Cart 2.Click Proceed To Checkout & Login 3.On Payment page, enter alphabetic characters in 'Card Number, CVV, and Expiration' fields. 4.Click 'Pay' and Confirm Order	The system should validate the input fields, display an error message, and prevent the transaction if non-numeric data is entered in the Card Number, CVV or Expiration Date	Checks if exceptions are handled correctly and prevents payment processing errors.
Partial Keyword Search T4	1.Click on 'Products' button 2.Enter a partial keyword (e.g. "Blue") 3.Check if the products contain the searched keyword	The search results must display products that match the partial keyword entered.	Ensures customers find products even when using partial terms.

Test Execution Summary

T1 – FAILED ✗

Clicking the button multiple times adds duplicate items to the cart

T2-PASSED ✓

T3- FAILED ✗

The system allow alphabetic characters in Card Number, CVV, and Expiry Date fields.

T4-PASSED ✓

Recommendations for Application Improvement

- **Implement numeric-only validation for Card Number, CVV and Expiry Date.**
- **The “Add to Cart” button should be disabled after the first click until the process is finished.**
- **A button to change the quantity should be added to the shopping cart.**
- **The system allows a user to subscribe with the same email address multiple times.Implement a validation check to see if an email aleardy exists ensures a cleaner database.**
